

第二类曲线积分

变力沿曲线做功

$$\vec{F}(x, y) = (P(x, y), Q(x, y))$$

$$\vec{F}(x, y, z) = (P(x, y, z), Q(x, y, z), R(x, y, z))$$

$$\lim \sum \vec{F}(\xi_i, \eta_i) \cdot \underset{\substack{\uparrow \\ \vec{T}_i \Delta S_i}}{\Delta \vec{r}_i} = \int_C \vec{F} \cdot d\vec{r} = \int_C P(x, y) dx + Q(x, y) dy$$

例 7.2.1 计算曲线积分 $\int_C xy dx$ C 是 $y^2 = x$ 上点 $A(1, -1)$ 到点 $B(1, 1)$ 的弧

$$\int_C xy dx = \int_{-1}^1 2y^4 dy = \frac{4}{5}$$

例 7.2.2 计算曲线积分 $\int_C y^2 dx$, C 为按逆时针方向绕行的上半圆周 $x^2 + y^2 = a^2$ ($y \geq 0$)

$$\int_C y^2 dx = \int_0^\pi a^2 \sin^2 \theta d \cos x = a^3 \int_0^\pi (\cos \theta - \frac{1}{3} \cos^3 \theta) \Big|_0^\pi = -\frac{4}{3} a^3$$

例 7.2.3 计算 $\int_C y^2 dx + z^2 dy + x^2 dz$ C 为 $\begin{cases} x^2 + y^2 + z^2 = a^2 \\ x^2 + y^2 = ax \end{cases}, z \geq 0, a > 0$

设 $x = \frac{a}{2} + \frac{a}{2} \cos t, y = \frac{a}{2} \sin t$

$z = \sqrt{a^2 - x^2 - y^2} = \sqrt{a^2 - (\frac{a}{2} + \frac{a}{2} \cos t) \cdot a} = a \sin \frac{t}{2}$

代入 原式 $= \int_0^{2\pi} (-\frac{a^3 \sin^3 t}{8} + \frac{a^3 \sin^2(\frac{t}{2}) \cos t}{2} + \frac{a^3 (1 + \cos t)^2 \cos \frac{t}{2}}{8}) dt$

$= \frac{a^3}{8} (\cos t - \frac{1}{3} \cos^3 t) + \frac{a^3}{4} (\sin t - \frac{t}{2} - \frac{1}{4} \sin 2t) + a^3 (\sin \frac{t}{2} - \frac{2}{3} \sin^3 \frac{t}{2} + \frac{1}{5} \sin^5 \frac{t}{2}) \Big|_0^{2\pi}$

$= -\frac{\pi a^3}{4}$

设曲线 Γ 为 $0 \leq x \leq \pi, 0 \leq y \leq \sin x$ 的边界的逆时针方向, 向量 n 为 Γ 的外法向量, 函数 $f(x, y) = e^x(y - \sin y)$, $\frac{\partial f}{\partial n}$ 表示 f 沿 n 的方向导数, 试把 $\int_{\Gamma} \frac{\partial f}{\partial n} ds$ 化为第二型曲线积分

$$\begin{aligned} \int_{\Gamma} \frac{\partial f}{\partial n} ds &= \int_{\Gamma} (-f_1 \cos \beta + f_2 \cos \alpha) ds \\ &= \int_{\Gamma} (f_2 \cos \alpha - f_1 \cos \beta) ds \\ &= \int_{\Gamma} f_2 dx - f_1 dy \end{aligned}$$
