

设三角级数

$$\frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx)$$

在 $[-\pi, \pi]$ 上一致收敛于 $f(x)$

$$\Rightarrow \begin{cases} a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx \, dx \\ b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx \, dx \end{cases}$$

$$\int_{-\pi}^{\pi} f(x) \, dx = \int_{-\pi}^{\pi} \frac{a_0}{2} \, dx + \sum_{n=1}^{\infty} a_n \underbrace{\int_{-\pi}^{\pi} \cos nx \, dx}_0 + \sum_{n=1}^{\infty} b_n \underbrace{\int_{-\pi}^{\pi} \sin nx \, dx}_0$$

$$\Rightarrow a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \, dx$$

$$\int_{-\pi}^{\pi} f(x) \cdot \cos kx \, dx = \frac{a_0}{2} \underbrace{\int_{-\pi}^{\pi} \cos kx \, dx}_0 + \sum_{n=1}^{\infty} a_n \int_{-\pi}^{\pi} \cos nx \cos kx \, dx + \sum_{n=1}^{\infty} b_n \int_{-\pi}^{\pi} \sin nx \cos kx \, dx$$

$$\text{当 } k=n \text{ 时, 有 } a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx \, dx$$

狄利克雷收敛定理

设 $f(x)$ 是周期为 2π 的周期函数.

若 $f(x)$ 在 $[-\pi, \pi]$ 上连续或只有有限个第一类间断点,

若 $f(x)$ 在 $[-\pi, \pi]$ 上至多只有有限个严格极值点, 即 $f(x)$ 在 $[-\pi, \pi]$ 上分段单调. 则 $f(x)$ 的傅里叶级数收敛

$$\frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx) = \begin{cases} f(x) & x \text{ 为 } f(x) \text{ 的连续点} \\ \frac{f(x^+) + f(x^-)}{2} & x \text{ 为 } f(x) \text{ 的间断点} \end{cases}$$

设 $f(x)$ 是偶函数

$$\text{则 } b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = 0$$

则 $f(x)$ 的傅里叶级数中只含余弦函数. 称为余弦级数

设 $f(x)$ 是奇函数

$$\text{则 } a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = 0$$

则 $f(x)$ 的傅里叶级数中只含正弦函数. 称为正弦级数

例: 设 $f(x) = |x|$, $x \in [-\pi, \pi]$ 周期为 2π . 求 $f(x)$ 的傅里叶级数

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cdot \cos nx \, dx = \frac{2}{\pi} \int_0^{\pi} f(x) \cdot \cos nx \, dx$$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} |x| \, dx = \frac{2}{\pi} \int_0^{\pi} x \, dx = \pi$$

$$\begin{aligned} a_n &= \frac{2}{\pi} \int_0^{\pi} x \cos nx \, dx = \frac{2}{\pi} \left(\frac{x \sin nx}{n} \Big|_0^{\pi} - \int_0^{\pi} \frac{\sin nx}{n} \, dx \right) \\ &= \frac{2}{\pi} \frac{\cos nx}{n^2} \Big|_0^{\pi} = \frac{2}{\pi} \frac{(-1)^n - 1}{n^2} = \begin{cases} 0 & n=2k \\ -\frac{4}{n^2\pi} & n=2k-1 \end{cases} \end{aligned}$$

$$f(x) \sim \frac{\pi}{2} - \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{1}{(2n-1)^2} \cos((2n-1)x)$$

$f(x) = x^2$ $x \in [-\pi, \pi]$ 作周期为 2π 的延拓

$$a_0 = \frac{2}{\pi} \int_0^{\pi} x^2 \, dx = \frac{2}{\pi} \cdot \frac{1}{3} \pi^3 = \frac{2}{3} \pi^2$$

$$\begin{aligned} a_n &= \frac{2}{\pi} \int_0^{\pi} x^2 \cdot \cos nx \, dx = \frac{2}{\pi} \left(\frac{x^2 \sin nx}{n} \Big|_0^{\pi} - \int_0^{\pi} \frac{2x \cdot \sin nx}{n} \, dx \right) \\ &= \frac{2}{\pi} \left(\frac{2x \cos nx}{n^2} \Big|_0^{\pi} - \int_0^{\pi} \frac{2 \cos nx}{n^2} \, dx \right) = \frac{4(-1)^n}{n^2} \end{aligned}$$

$$f(x) \sim \frac{\pi^2}{3} + \sum_{n=1}^{\infty} \frac{4(-1)^n}{n^2} \cdot \cos nx = x^2 \quad x \in [-\pi, \pi]$$

$$\text{令 } x = \pi \quad \frac{1}{3} \pi^2 + \sum_{n=1}^{\infty} \frac{4}{n^2} = \pi^2 \Rightarrow \sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{1}{4} \pi^2 \left(1 - \frac{1}{3}\right) = \frac{\pi^2}{6}$$

$$\text{令 } x = 0 \quad \frac{1}{3} \pi^2 + \sum_{n=1}^{\infty} \frac{4(-1)^n}{n^2} = 0 \Rightarrow \sum_{n=1}^{\infty} \frac{(-1)^n}{n^2} = -\frac{\pi^2}{12}$$

求函数 $f(x) = \begin{cases} 1 & 0 < x < \frac{\pi}{2} \\ 0 & \frac{\pi}{2} < x < \pi \end{cases}$ 的正弦级数展式

作周期为 2π 的奇延拓

$$b_n = \frac{2}{\pi} \int_0^{\pi} f(x) \cdot \sin nx \, dx = \frac{2}{\pi} \int_0^{\frac{\pi}{2}} \sin nx \, dx$$

$$= \frac{2}{\pi} \left(-\frac{\cos nx}{n} \right) \Big|_0^{\frac{\pi}{2}} = \frac{2}{n\pi} (1 - \cos n \cdot \frac{\pi}{2})$$

$$= \begin{cases} 0 & n=0 \pmod{4} \\ \frac{2}{n\pi} & n=1 \pmod{4} \\ \frac{4}{n\pi} & n=2 \pmod{4} \\ \frac{2}{n\pi} & n=3 \pmod{4} \end{cases}$$
